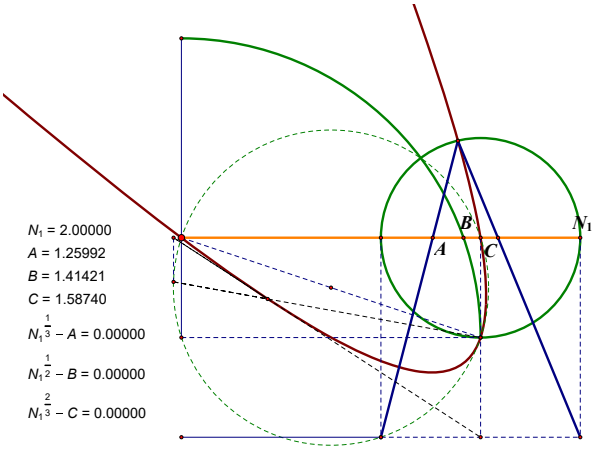
Altar of Apollo

Sunday, May 28, 2023

Apollo: Greek Mythology a god, son of Zeus and Leto and brother of Artemis. He is associated with music, poetic inspiration, archery, prophecy, medicine, pastoral life, and in later poetry with the sun; the sanctuary at Delphi was dedicated to him.

Duplicating the Altar of Apollo.

A mind is the governing life support system designed to attain mastery over the whole environment so that man can have life and have it more abundantly.



A mind does its job through the recursion of memory, which is called learning and judgment.

All a mind can do is then read, called perception, even information gathering, or data. It then processes that information via systems of grammar of which there are four categories; Common Grammar, Arithmetic, Algebra and Geometry.

As information is binary, i.e., limits and relative differences between limits, then information processing is a method of binary recursion, which Plato called Dialectic; speech in accordance with the two elements of a thing, i.e., nouns and verbs, point and line.

As the mind is the most powerful life support system possible, when functional, it also means that a mind is functional when literate, and that it is literate when it can process information using all four members of our Grammar Matrix. Thus the demand to duplicate the Altar of Apollo, is just another way of putting the goal stated in the Judeo-Christian Scripture into another expression, that man will suffer until he learns judgment. To claim that we know judgment is the claim that we can demonstrate our words in all four systems of grammar.

Can a myth predict biological fact which has taken mankind thousands of years to learn? Does changing the name of a thing, or constructing that name in any of our four systems of grammar, in any wise, change the perceptible or intelligible thing named? Absolutely not.

Binary recursion means that we can recursively apply not only the relative, but the correlative as well, thus, geometry is not limited by straightedge and compass as mechanical tools, but limited by the idea of binary recursion, a well defined unit.

I solved the Delian Problem as a geometric construction around twenty-five years ago, but the real solution is, as in the Bible, the day that mankind learns judgment, i.e., can do the math.

My goal, should be everyone's goal, to write and teach a mind how to do its biologically defined job, a job which is the most difficult job to do; a job a fool cannot do.
